

Instructions for installing the OPSWAT security application on Apple Mac

These instructions are for installing the OPSWAT security application which, once installed on to a connecting device (UYOD PC or Laptop), will check to ensure the device is updated and adequately protected by an Anti-Virus product. If OPSWAT finds vulnerabilities it will display a report with instructions to take remedial action – e.g. run “MacOS Update”, update anti-virus software, etc.

If your device does not pass the necessary tests then your device will be prevented from accessing the UYOD VDI until the issues are remedied.

These checks will include a comprehensive examination of your device’s software and hardware configurations. It will not access any data, personal data or internet browsing history etc. These checks are important to ensure the integrity of the solution and protect against cyber threats as the solution connects to the NECS network and accesses clinical platforms.

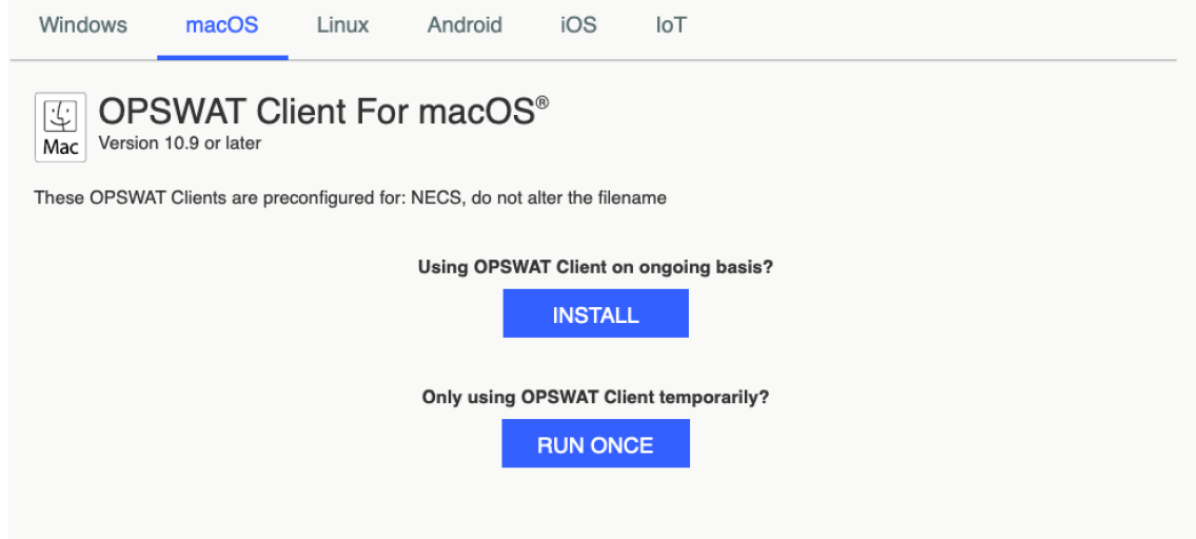

If OPSWAT finds vulnerabilities it will display a report with instructions to take remedial action – e.g. run “MacOS Update”, update anti-virus software, etc.

Click on the link below on your own device (not a NECS provided computer) to access:

<https://necsu.github.io>

Download OPSWAT® Client

The OPSWAT Client allows your MetaAccess administrator to view the security status of your device. It does not enable remote control, remote management or access to your private information and documents.

Press the INSTALL button under the “Using OPSWAT Client on ongoing basis”.

Only connecting devices which have OPSWAT installed (and are appropriately patched) will be able to access the VDI solution.

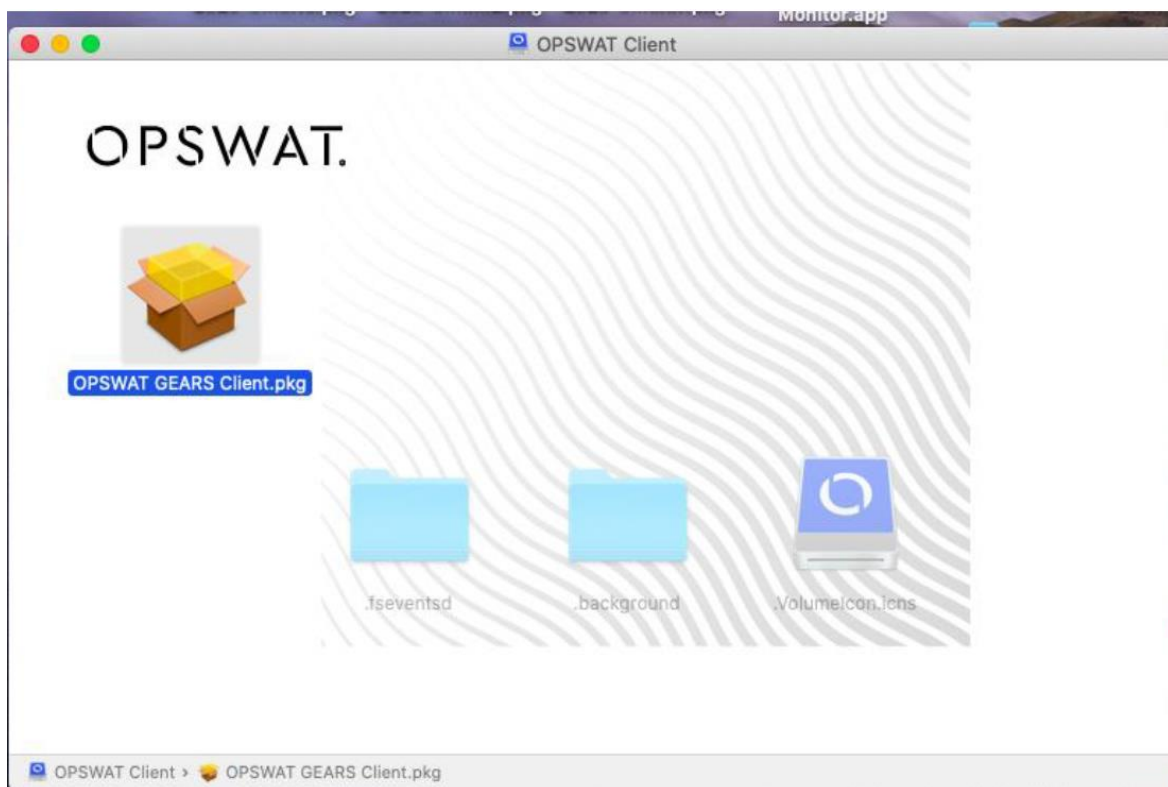

Open Downloads in the right hand side of the task bar

Open the OPSWAT Gears client installer by double clicking it.

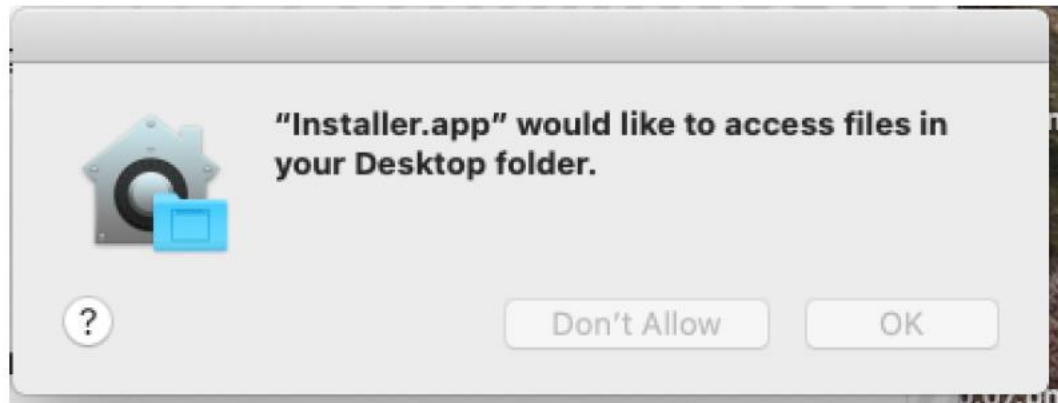

Double click on the installer package

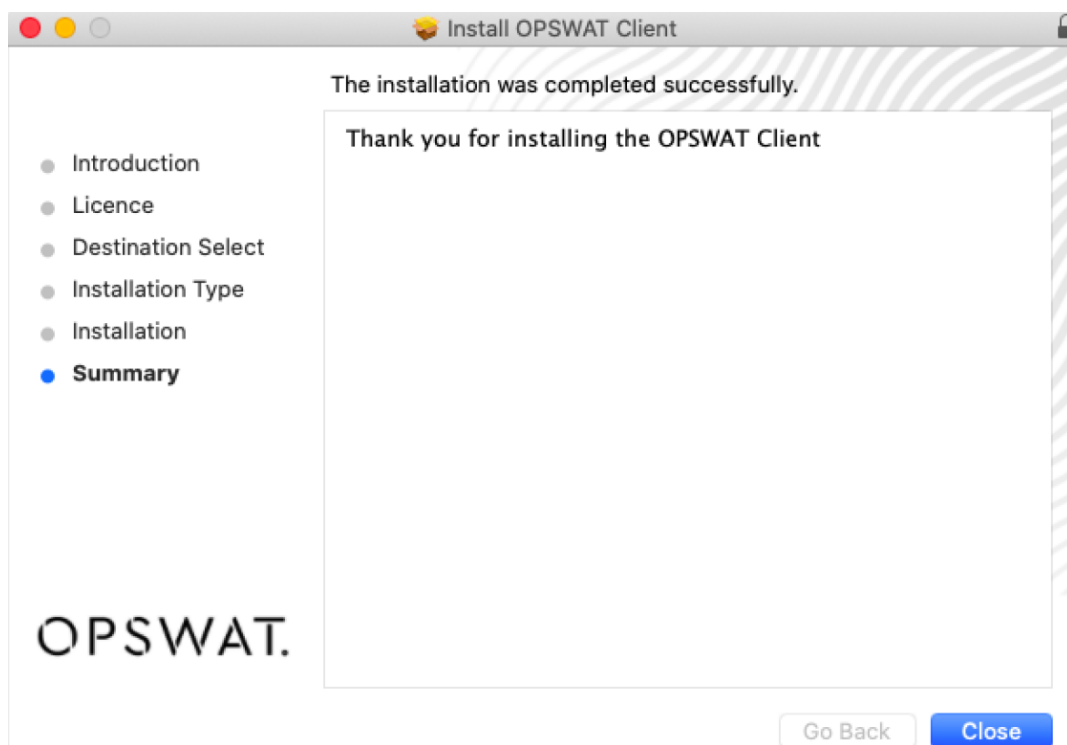

And follow the dialogue by accepting, agreeing and continuing to the various prompts. You will be asked for the administrator password for the machine you are installing this on.

Hit OK at the succeeding 3 "installer would like to..." prompts you will get

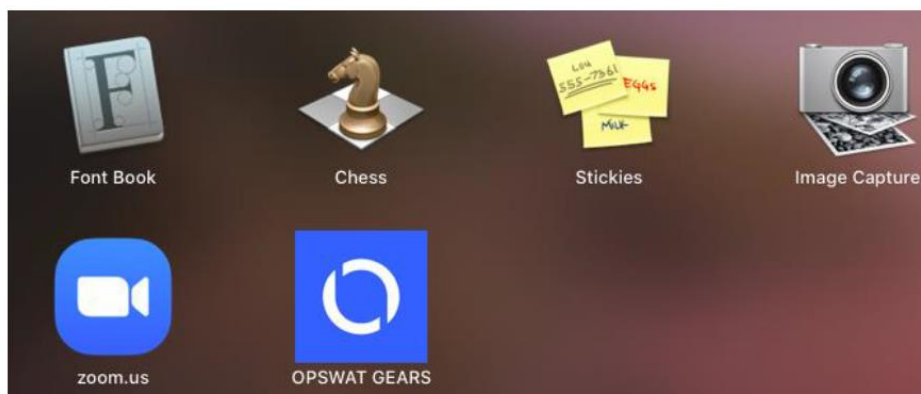

You should then get this prompt to indicate successful installation

Close this dialogue box.

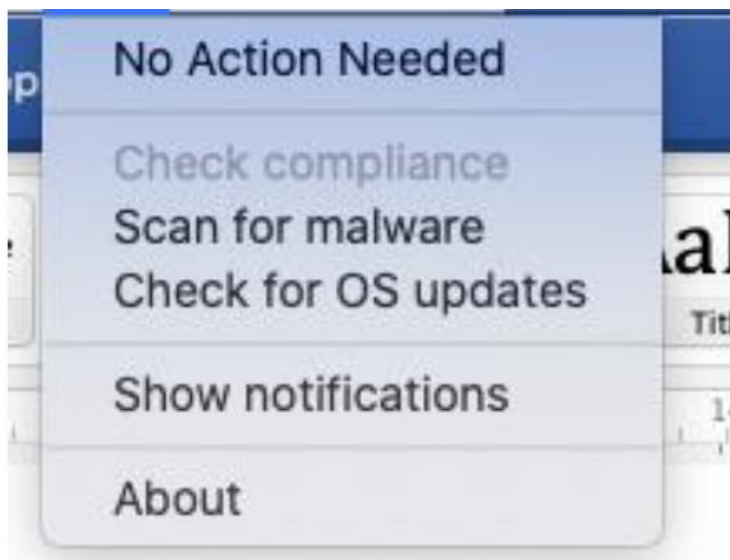

You will then have the OPSWAT Gears client installed and should see it in your launchpad

And it should also be active on your system tray at the top of your screen – the circular icon second on the left here

Right click the icon and select “Check compliance”, which will display “No Action Needed” if your machine is compliant or will flag that Remediation actions are required. You can also scan for malware, or check for OS updates. Selecting “Show notifications” will toggle on/off the display of notifications.

Selecting either “No Action Required” or “Remediation actions required” will navigate to a status page with either the compliance status confirmation or details of the remediation activities required.
